## Machine learning on smart-grid data

## Outline

- smart-grid infrastructure
- available data
- data quality
- example questions / problems
- machine learning applications
- machine learning on big data - boosted decision trees

## Smart-grid infrastructure

## Electrical infrastructure

## Available data I

- static
- topological data, consumer distribution tariff, FW version, ...
- dynamic
- sensor measurements
- consumption, production, voltage, current, ... (ca. 30 variables, 15 min period)
- events reported by devices
- tariff switching, power on/off, overvoltage, ...
- \% data transferred, transmission failure, ...
- monitoring data
- memory available, battery status, communication times, ...

## Available data II

- additional computed / derived data
- data from external sources
- weather forecast, cellular infrastructure data, ...
- millions of customers $\Rightarrow$ millions of devices $\Rightarrow$ billions of measurements per day
- 3.5 millions of smart-meters (ČEZ)
- 30 measured variables
- 96 measurements a day
- $3.5 \times 10^{6} \times 96 \times 30 \times 4 B \sim 40$ GB / day
- soon becomes „BIG DATA"

## Data quality

- high reliability (but not always!)
- communication issues
$\Rightarrow$ missing data
$\Rightarrow$ inhomogeneity
- inconsistency issues
- need for complex validation
- data quality and completeness determination
- missing values imputation / estimation

## Example questions / problems

- operational problems detection and identification
- local load control
- can we balance local consumption and production?
- solar plants x water heaters, el. heating, batteries, ...
- technical / non-technical losses
- problematic localities identification
- customer clustering

## Machine learning application - regression I

- quantitative output
- looking for function $\mathbb{R}^{n} \rightarrow \mathbb{R}$
- many methods
- metrics
- mean square error (MSE)
- mean absolute error (MAE)
- missing data imputation
- prediction of future values

| c15 | $t$ | 15m | day | cavg | tavg | $\cdots$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 76 | 12.36 | 77 | 119 | 494 | 7.21 | $\ldots$ |
| 4158 | 3.64 | 2 | 89 | 842 | 5.71 | $\ldots$ |
| 1041 | 8.76 | 89 | 89 | 494 | 9.20 | $\ldots$ |
| 267 | -3.46 | 94 | 5 | 47 | -2.94 | $\ldots$ |
| 1131 | -10.9 | 13 | 21 | 494 | -7.88 | $\ldots$ |
| .. |  |  |  |  |  |  |

| ? | 20.74 | 72 | 208 | 125 | 19.17 | $\ldots$ |
| ? | 10.37 | 24 | 102 | 842 | 11.34 | $\ldots$ |

## Machine learning application - regression II

## Machine learning applications - classification

- qualitative output ( $f: \mathbb{R}^{\mathrm{n}} \rightarrow \mathrm{C}$ )
- finite set of classes
- metrics
- accuracy
- precision / recall
- AUC
- localities
- controllable / uncontrollable
- problematic / stable

| $\boldsymbol{y}$ | $\boldsymbol{x}_{\mathbf{1}}$ | $\boldsymbol{x}_{\mathbf{2}}$ | $\boldsymbol{x}_{\mathbf{3}}$ | $\ldots$ |  |
| :---: | ---: | ---: | ---: | :---: | :---: |
| A | 2.5 | 0.1 | -3.1 | $\ldots$ |  |
| C | -9.3 | -3.7 | 8.0 | $\ldots$ |  |
| B | -2.1 | 1.9 | -9.2 | $\ldots$ |  |
| A | 6.3 | 3.3 | -3.2 | $\ldots$ |  |
| D | 7.0 | -7.7 | 3.8 | $\ldots$ |  |
| $\ldots$ |  |  |  |  |  |
| $?$ | 1.8 | 5.4 | 3.8 | $\ldots$ |  |
| $?$ | -3.5 | -0.8 | 2.2 | $\ldots$ |  |
| $?$ | 7.7 | 9.9 | 1.9 | $\ldots$ |  |

- operational problems

## Machine learning applications - clustering

- grouping similar objects together
- unsupervised learning
- many different metrics / algorithms
- hard to evaluate

## Machine learning applications - anomaly detection

- detection of suspicious measurements
- detection of operational problems
- multivariate time-series

Detekce anomalii PM_0736 normalni rozdeleni

## Machine learning on big data - boosted decision trees I

## Decision trees

- split nodes
- greedy algorithm
- minimize cost function acc. to metric
- leaves
- mean of outputs (reg.)
- majority / distribution of classes (cl.)

## Machine learning on big data - boosted decision trees II

## Boosting

- ensemble model - forest rather than just one tree
- each tree built to minimize the error of the previous ones
- robustness

## Machine learning on big data - boosted decision trees III

## Obliviousness

- splits on each level are the same
- computational speed boost
- learning phase
- evaluation phase (no if's)
- robustness
- resistance to overfitting
- resistance to outliers

## Machine learning on big data - boosted decision trees IV

Training on big data - distributed version

- Ph.D. thesis
- cost function computable „part by part"
- not all of them satisfy the condition
- minimize the number of passes through data
- efficiency
- fit into map-reduce or similar paradim
